

Project: React Task Management

Problem Statement:

Develop a Task Management Tool using React that allows users to efficiently manage their tasks. The application should enable users to add new tasks, mark tasks as completed, and delete tasks. Completed tasks should automatically be moved to the end of the task list, ensuring that users focus on their pending tasks first.

Objective:

The objective of the Task Management Tool is to create an efficient application that allows users to add, delete, and mark tasks as completed. It aims to enhance productivity by prioritizing pending tasks while ensuring completed tasks are organized at the end of the list. The tool will feature a user-friendly, responsive interface for both desktop and mobile devices. By utilizing React best practices, the application will be maintainable and scalable. Overall, it will empower users to manage their tasks effectively and streamline their workflow.

Tasks to be Performed:

Add Task:

- Users should be able to input a task description and add it to the task list.
- Each task should have a unique identifier.

Edit Task:

- Users should have the option to edit the description of any existing task.
- The updated task should reflect immediately in the task list.

Delete Task:

- Users should be able to delete any task from the list.
- Upon deletion, the task should be removed immediately from the display.

Mark as Completed:

- Users should have the option to mark a task as completed.
- Once marked as completed, the task should be visually distinguished from pending tasks (e.g., strikethrough text).

Reordering Tasks:

- Completed tasks should automatically move to the bottom of the task list.
- The order of pending tasks should remain unchanged.
