

## **Java Fundamentals: Simple Calculator Assignment - 2**

## Problem Statement:

You are tasked to create a Java program that emulates a simple calculator. The program should take two numerical inputs and an operator from the user and perform the corresponding arithmetic operation on the inputs. The supported operators are addition (+), subtraction (-), multiplication (\*), and division (/).

## Requirements:

The program should prompt the user to enter the first number, the operator, and the second number.

1. Validate the inputs to ensure that they are valid numerical values and that the operator is one of the supported operators (+, -, \*, /).
2. Perform the arithmetic operation based on the entered operator and display the result to the user.
3. If the user enters an invalid operator or attempts division by zero, provide appropriate error messages and ask for inputs again.
4. Allow the user to continue using the calculator until they choose to exit the program.
